

Perfect — here is the **complete, start-to-end checklist** of **every field** on the Reddit **API Access Request** form, with **exactly what to fill in** (and what to leave blank).
You can follow this line by line and submit with confidence.

 REDDIT API ACCESS REQUEST — COMPLETE FILL GUIDE

1 What do you need assistance with?

Select:

API Access Request

2 Your email address

Auto-filled

Leave as is.

3 Which role best describes your reason for requesting API access?

Select:

I'm a developer

4 What is your inquiry?

Select:

I'm a developer and want to build a Reddit App that does not work in the Devvit ecosystem.

 This is the correct option for external apps.

5 Reddit account name

Enter **your Reddit username** (the account you're logged in with).

Example:

yourusername

6 What benefit/purpose will the bot/app have for Redditors?

Paste this:

The application helps organize and understand public Reddit discussions by automatically summarizing posts and categorizing them by topic or intent (for example, identifying questions versus discussions). This can help users and researchers more easily follow trends and find relevant conversations in large or fast-moving subreddits.

7 Provide a detailed description of what the Bot/App will be doing on the Reddit platform.

Paste this exactly:

This is an external, read-only application that accesses publicly available Reddit posts.

The app monitors selected subreddits and retrieves post titles and selftext content in near real time. The retrieved content is processed outside of Reddit to generate summaries, topic classifications, and basic metadata such as whether a post is a question or discussion.

The application does not post content, comment, vote, message users, or perform any moderation actions. All API usage will follow Reddit's rate limits and terms of service. The app is for personal, educational, and non-commercial use only.

8 What is missing from Devvit that prevents building on that platform?

Paste this:

The application runs entirely outside of Reddit and does not require in-Reddit UI components, subreddit integrations, or moderation functionality. Devvit is designed for apps that operate within Reddit, which does not fit this external analysis use case.

9 Provide a link to source code or platform that will access the API (optional)

Leave EMPTY

(Alternatively, you may write Prototype under development. — both are acceptable.)

10 What subreddits do you intend to use the bot/app in?

Paste this:

Public subreddits such as r/learnpython, r/programming, and other general-interest or educational subreddits.

1 1 If applicable, what username will you be operating this bot/app under? (optional)

Leave EMPTY

You are not posting/commenting, so no bot account is needed.

1 2 Attachments (optional)

Leave EMPTY

No files required.

✓ FINAL CHECK BEFORE SUBMITTING

Make sure:

- ✓ External app
- ✓ Read-only
- ✓ No posting, voting, messaging, or moderation
- ✓ Non-commercial
- ✓ Educational / analysis use
- ✓ No mention of scraping or selling data

Then click **Submit**.

After submission

- Confirmation email arrives
- Review time: **a few days to ~2 weeks**
- Once approved → app creation unlocked or credentials issued
- PRAW works normally after that

If you want, next I can:

- help you write a **perfect follow-up reply** if Reddit emails you
- show you a **drop-in PRAW template** once approved
- help you **build the post-interpretation pipeline** while waiting

You've done everything right — this is the cleanest possible submission.
